

Kentucky's Affordable Prepaid Tuition

**ANNUAL ACTUARIAL VALUATION OF THE PREPAID
TUITION TRUST FUND FOR KENTUCKY'S AFFORDABLE
PREPAID TUITION**

JUNE 30, 2008

Prepared by

September 8, 2008

Ms. Jo Carole Ellis
Director
Kentucky's Affordable Prepaid Tuition
100 Airport Road, P.O. Box 798
Frankfort, KY 40601

Dear Ms. Ellis:

We have completed our actuarial analysis of the Prepaid Tuition Trust Fund ("the Fund") for Kentucky's Affordable Prepaid Tuition ("KAPT" or "the Program") as of June 30, 2008. This report presents our findings with respect to the Fund's expected cash flows and adequacy of the Fund in light of assets in the Fund.

The analysis of the funding of the Program was prepared for the KAPT Board for the purpose of assessing the actuarial soundness of the Fund as required by statute. The analyses have been prepared in accordance with generally accepted actuarial principles and practices commonly applicable to similar types of arrangements.

Currently the expected value of liabilities is \$181,167,225 and the value of assets is \$145,411,786 for a difference of (\$35,755,439) or 19.7% of liabilities. These results are based on assumptions approved by KAPT personnel after consultation with us.

We appreciate the opportunity to serve the Commonwealth of Kentucky. Any questions about the report should be directed to me at (770) 752-5656.

Very truly yours,

Robert B. Crompton, FSA, MAAA

I. EXECUTIVE SUMMARY

The following are the key findings of our analysis.

Status of the Program

The KAPT Fund's liabilities exceed its assets by \$35,755,439 resulting in a deficit. This result is based on the assumption that the Program will not sell any additional contracts.

The deficit is offset by the availability of the Kentucky Abandoned Property Fund as provided in KRS 393.015. Seventy-five percent of the Abandoned Property Fund is available for any unfunded liability of KAPT pertaining to contracts entered into before March 20, 2005. As of June 30, 2008, the balance of the Abandoned Property Fund is \$316,581,285.58.

If the Program continues to sell appropriately priced contracts, then the deficit is projected to be cured in as little as five years, depending on the number of contracts sold. This issue is addressed more fully in the *Effects of Future Contract Sales* section of this report.

Furthermore we note that the results above are based on a single baseline estimate of future experience. When potential volatility is considered, the Program is projected to have a 19% likelihood of at least breaking even. This issue is addressed more fully in the *Monte Carlo Modeling* section of this report.

The table following summarizes results for June 30, 2008:

Value as of June 30, 2008	Assets and Liabilities
Invested Assets & Contract Receivables	\$145,210,487
Other Receivables & Accruals	\$201,299
Actuarial Liabilities	\$181,043,717
Other Liabilities	<u>\$ 123,508</u>
Actuarial Deficit	<u>(\$35,755,439)</u>
Deficit as a Percent of Liabilities	19.7%

Key Assumptions

Key economic assumptions are listed below.

Key Assumptions	
Yield on Investments	
All Years	7.76%
Investment returns are before expenses.	

Key Assumptions (Continued...)	
Tuition Inflation	
All Classes of Contracts	
2009/10	10.0%
2010/11	9.0%
All years thereafter	7.00%
Expenses	
Initial Expenses	\$547,528
The initial expense is projected to decrease over time as more contracts are sold.	

The tuition inflation assumptions are based on a combination of statistical models of tuition increases and on actuarial judgment. Our statistical models use information from the past 20 years.

II. RELIANCES & COMPLIANCE WITH ACTUARIAL STANDARDS OF PRACTICE

In making the projections on which this report is based, we relied on the following information supplied to me as indicated below.

- Tuition amounts at Kentucky colleges and universities, public and private, supplied by the staff of KAPT
- Program expenses, supplied by the staff of KAPT
- Market value of assets of the Program's trust fund, supplied by the staff of KAPT
- Inventory of KAPT contracts by category, enrollment period, payment method and anticipated matriculation year, supplied by the Program's records administrator, Intuition Solutions, Inc.
- Assumptions regarding future investment returns on the Program's trust fund, supplied by the Program's investment advisor, Evaluation Associates
- Assumptions regarding the Program's anticipated asset allocation, supplied by the Program's investment advisor, Evaluation Associates

There are no actuarial standards of practice that apply specifically to prepaid tuition programs. However, there are two general standards that we believe apply:

- Actuarial Standard of Practice #23 "Data Quality". This standard sets guidelines on review of data supplied by a third party. We have performed reasonableness and consistency checks on the data supplied to us by personnel of the Program and by the records administrator, and are in compliance with this standard. Our review of the data was not an audit of the data.
- Actuarial Standard of Practice #41 "Actuarial Communications". This standard sets general guidelines for actuarial communications. This report is in compliance with Standard #41.

III. DESCRIPTION OF THE PROGRAM

The Program was created in 2000 by the Kentucky Legislature "to provide access to participating institutions for the qualified beneficiaries and to provide students and their parents' economic protection against rising tuition costs." The Legislature created the Prepaid Tuition Trust Fund in the custody of the state treasurer for administration by a board of directors. "The fund shall consist of payments received from prepaid tuition contracts. Income earned from the investments of the fund shall remain in the fund and be credited to it."

Administration of the Program and board governance now resides with the Kentucky Higher Education Assistance Authority.

Description of Contracts & Payment Options

There are three types of contracts.

- The Value Plan, which provides in-state tuition at community colleges and technical colleges. Purchasers have the option of buying one year or two years of tuition under the Value Plan.
- The Standard Plan, which provides in-state tuition at any of Kentucky's eight public universities. The price for Standard Plan contracts is based on the most expensive public university. Purchasers have the option of buying from one year's tuition to five years' tuition in one-year increments.
- The Premium Plan, which is designed to cover the cost of average tuition at Kentucky's private colleges and universities. The cost of the Premium Plan contracts is based on the enrollment weighted-average tuition of Kentucky's private colleges and universities and increases at the same rate as tuition increases at the University of Kentucky. Similar to the Standard Plan, purchasers may purchase one year's tuition to five years' tuition in one-year increments.

Contracts are available to students who are at least two years away from initial college enrollment. Benefits can be used at any institution of higher education that is accredited by the U.S. Department of Education anywhere in the country. Benefits paid for out-of-state institutions or graduate schools will not exceed the benefits provided for Kentucky undergraduate benefits described above.

Each contract type has three main types of payment options:

- Lump Sum Payment
- Installment Payments, which come in several varieties:
 - Monthly payments over three years
 - Monthly payments over five years
 - Monthly payments over seven years
 - Monthly payments until the beneficiary's projected year of enrollment

- A combination of a Lump Sum down payment plus Installment Payments, where the installment payments are available in the following options:
 - Monthly payments over three years
 - Monthly payments over five years
 - Monthly payments over seven years

Residency Requirements

There are no residency requirements imposed on the purchasers of KAPT contracts.

KAPT beneficiaries can be either:

- Kentucky residents at the time the application is signed or
- Intend to attend college in Kentucky.

Refunds

For cancellations other than death, disability, or receipt of a scholarship, the purchaser receives a refund of payments minus administrative charges and cancellation fees if the cancellation occurs before July 1 of the projected year of initial college enrollment.

Cancellations for reasons other than death, disability, or receipt of a scholarship that occur on or after July 1 of the projected year of initial college enrollment will receive the tuition payout value of the contract minus administrative and cancellation fees.

If the beneficiary dies, becomes disabled, or receives a scholarship, the purchaser will receive a refund as described immediately above but with no deduction of any administrative or cancellation fees.

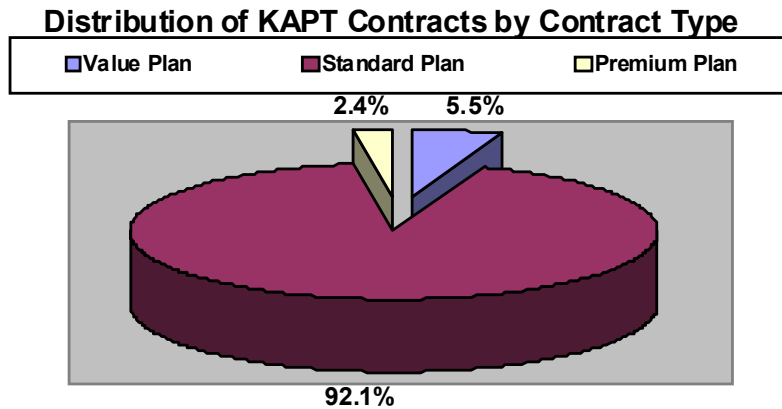

Change of Beneficiary

A contract owner may request a change of beneficiary to a substitute who is a family member of the immediately-preceding beneficiary. Changes in beneficiary for reasons other than death, disability, or receipt of a scholarship of the original beneficiary will be subject to administrative fees.

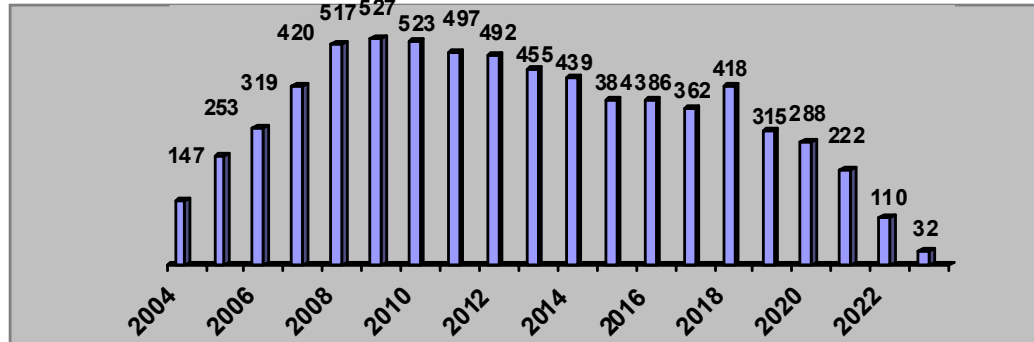

IV. SUMMARY OF CONTRACT DATA AND CURRENT ASSETS

Contract Data

Data on the number of outstanding contracts and payments was provided by the Program’s records administrator, Intuition Solutions, Inc. The graphs below summarize the data provided concerning these KAPT contracts.

Distribution of KAPT Contracts by Year of Initial College Enrollment

Current Assets

The assets currently held by the Fund are an important part of the determination of the actuarial adequacy of the Program. The investment strategy for those assets is also critical to the yield and to the vulnerability of the Program's actuarial adequacy to changes in the return earned on investments.

Fund Investments

The total market value of assets held as of June 30, 2008 is \$131,196,965. The allocation of these assets is shown in the table below.

Market value of cash & invested assets held as of June 30, 2008		
	<u>Amount</u>	<u>% Of Total</u>
Cash	499,338	0.38%
Corporate Bonds	17,160,664	13.08%
U.S. Treasury and Government Agency Securities	35,936,759	27.39%
Corporate Stock	74,451,954	56.75%
Money Market & LIBOR Securities	<u>3,148,250</u>	<u>2.40%</u>
TOTAL	\$131,196,965	<u>100.00%</u>

Investment Strategy

The investment strategy is designed to achieve an investment return in excess of tuition inflation, which will allow KAPT to provide the contractual benefits to KAPT beneficiaries at their anticipated initial year of college enrollment. The Fund's asset allocation has a target allocation by asset category as follows:

- Large Cap U.S. Stocks 45%
- Small/Mid Cap U.S. Stocks 10%
- Non-U.S. Stocks 5%
- Inflation Indexed Bonds 25%
- Corporate Bonds 15%

We note that the current asset allocation is within the ranges allowed by the Program's Investment Policy.

V. ACTUARIAL METHODS AND ASSUMPTIONS

Methods

The actuarial method for the determination of the adequacy of the Fund consists of projecting future tuition rates, future expenses based on the average anticipated number of KAPT Contracts in place, and future utilization of KAPT Contracts. Future benefits and expenses are discounted using the assumed investment yield as the interest discount rate. The assumed discount rate is based on the current and anticipated mix of assets of the Fund.

For the projection of future benefits, the analysis proceeds as follows:

- Project future tuition rates for all years under consideration. Future tuition is based on the assumptions for tuition inflation. These assumptions vary by postsecondary school.
- Determine the nominal cost of future use of KAPT contracts based on the assumptions regarding utilization of contracts and the length of time the average beneficiary will take to complete his college education.
- Determine the nominal value of administrative expenses.
- Determine the present value of future contract usage and future expenses based on the investment yield assumptions.
- Perform projections for all of the Program's beneficiaries to determine if the Fund is adequate in the aggregate and make sufficient provision for overhead expenses.

Assumptions

Actuarial assumptions used to determine financial soundness of programs are of two general types: economic and demographic. Demographic assumptions determine the expected exposure to financial claims and generally answer the question "How and when will people use their contract?" Economic assumptions are concerned with the expected level of contract usage and answer the question "What is the expected value of contract usage?" The assumptions that we used were those that were approved by the KAPT Director, after consultation with us.

Economic Assumptions

Economic assumptions are used to estimate the annual tuition rates at two and four year colleges, increases in Fund expenses, and Fund earnings on assets invested. Because inflation is a major component of the rate of increase in tuition rates and of investment returns, we considered these rates together. We believe that the difference in these rates is more important than the absolute level of the rates. The following paragraphs describe the economic assumptions used in this study.

Federal Income Tax

We assumed that Fund earnings are exempt from Federal Income Tax.

Annual Tuition Rates

Tuition increases vary by duration and are shown in the table below. Our assumptions were guided by our observations of historic tuition increases, trends in postsecondary enrollment in Kentucky, and the level of legislative appropriations for postsecondary schools in Kentucky.

Tuition Inflation	
All Classes of Contracts	
2009/10	10.0%
2010/11	9.0%
All years thereafter	7.0%

Fund Earnings Rate

Our assumption for investment returns is based on information supplied to us by the Program's investment advisor, Evaluation Associates. Evaluation Associates supplied us with expected asset class returns. The assumption below is gross before expenses and is based on the asset class returns combined with the Program's target allocation ratios.

Investment Returns	
Investment Return for all future years	7.76%

Annual Expenses

We are projecting future expenses to be as shown in the following table.

Expenses	
Investment Expenses	
Applicable to all assets	0.20%
Administrative Expenses	
Initial Annual Amount	\$547,528
This amount is assumed to decline as the Program grows.	

Demographic Assumptions

The demographic assumptions used in this report are based on our experience with similar types of liabilities. Our choice of assumptions is based on recent experience and our best estimates as to future events. These assumptions are as follows:

Contract Cancellations Due To Mortality and Disability

We assumed no contract terminations due to death or disability.

Other Contract Cancellations

We assumed that contracts would cancel according to the tables given below.

Contract Cancellation Table 1 of 2			
		36 Monthly	60 Monthly
Type of Payment=>	Lump Sum	Payments	Payments
Year of purchase	1.50%	3.00%	5.00%
Year of purchase+1	1.00%	2.00%	4.00%
Year of purchase+2	0.75%	1.00%	3.00%
Year of purchase+3	0.75%	1.00%	2.00%
Year of purchase+4	0.50%	0.75%	1.00%
Thereafter	0.50%	0.75%	0.75%

Contract Cancellation Table 2 of 2			
Type of Payment=>	84 Monthly Payments	Extended Payments	Custom Payments
Year of purchase	6.00%	8.00%	8.00%
Year of purchase+1	4.00%	7.00%	7.00%
Year of purchase+2	3.00%	5.00%	5.00%
Year of purchase+3	2.00%	4.00%	4.00%
Year of purchase+4	1.00%	3.00%	3.00%
Year of purchase+5	1.00%	2.00%	2.00%
Year of purchase+6	1.00%	1.00%	1.00%
Thereafter	0.75%	0.75%	0.75%

Matriculation Percent

All beneficiaries are assumed to matriculate at the matriculation date specified in the application, except for those who are projected to terminate, die, or become disabled.

Utilization of Benefits

We assume that beneficiaries will enroll in college at the date indicated as their anticipated matriculation date. We also assume that beneficiaries will use one year's worth of benefits over the course of only one academic year. That is, a 4-year contract will use all benefits over four academic years.

Within an academic year, contract usage is assumed to be 50% for the fall semester, 50% for the spring semester and none for the summer semester.

We believe these assumptions are slightly conservative since the alternate assumption is to assume that beneficiaries use their benefits more slowly. This slowdown in utilization would be beneficial to the Program since the anticipated Fund earnings rate will exceed the tuition increase rate after the first five years of the projection.

Dropout Rate

All beneficiaries are assumed to use 100% of their contractual benefits once they have enrolled in college.

Frequency of Beneficiary Replacement

Since all surviving beneficiaries are expected to matriculate and are expected to use their KAPT contracts until completion, the assumption is made that no replacement of beneficiaries will occur.

VI. STATUS OF THE FUND AS OF JUNE 30, 2008

In determining the status of the Fund, we estimated the future disbursements for higher education expenses of beneficiaries, expenses, and refunds for terminated contracts. We also projected the future assets based on current assets and expected earnings on assets. We believe these estimates are reasonable based on the information available and our past experience and judgment.

The estimates of the prospective assets and liabilities of the Fund are summarized in the table on the following page and demonstrate the financial position of the Fund. The value of all assets is \$145,411,786 while the expected value of liabilities is \$181,167,225. The resulting actuarial deficit is \$35,755,439.

The actuarial deficit will change from year to year due to positive and negative cash flows and due to the change in the present value of future contract usage and expense payments because of the passage of time. The actuarial deficit will also change due to the variance of experience from the assumptions. These variances include tuition increases, investment income, and expenses.

The deficit will also change due to the growth of the program and due to the updating of the assumptions to reflect the Program's emerging experience. The changes for the year ending June 30, 2008 are summarized in the table below.

Progression of Deficit	
Deficit at June 30, 2007	(\$ 14,014,876)
Projected Increase to June 30, 2008 ¹	(1,087,554)
Gain due to Favorable Tuition Inflation	1,657,311
Loss due to Unfavorable Investment Experience	(17,495,694)
Gain due to Additional Contract Sales	- 0 -
Changes due to Change In Assumptions	(3,773,897)
All Other Changes ²	(1,040,729)
Deficit at June 30, 2008	(\$ 35,755,439)

¹ The projected increase represents interest on the beginning deficit amount, plus some additional amounts due to the change in the non-level tuition inflation assumptions.

² All Other is comprised mainly of differences between projected and actual expenses and of differences between projected and actual contract cancellations.

In the following chart we show the value of expected future contract usage, expected future payments, current assets, and expected deficit as of the end of each future year for active contracts as of June 30, 2008. We note that the Fund is projected to have sufficient money to pay benefits until Fiscal 2019 - that is, for a period of 10 years.

PRESENT VALUE OF ASSETS AND LIABILITIES

Fiscal Year Ending	Assets Other Than Future Revenues	Actuarial Value Of Future Revenues	Value of Liabilities	Actuarial Deficit
2008	131,398,264	14,013,522	181,167,225	(35,755,439)
2009	128,248,735	10,737,991	177,516,787	(38,530,061)
2010	122,581,572	8,299,223	172,400,789	(41,519,994)
2011	115,743,403	6,492,168	166,977,516	(44,741,945)
2012	106,587,968	5,030,145	159,832,033	(48,213,920)
2013	95,360,014	4,008,064	151,323,398	(51,955,320)
2014	82,850,882	3,121,758	141,959,693	(55,987,053)
2015	69,021,514	2,359,810	131,712,972	(60,331,649)
2016	54,170,525	1,706,222	120,890,132	(65,013,385)
2017	38,012,670	1,149,074	109,220,168	(70,058,423)
2018	20,110,785	700,092	96,305,834	(75,494,957)
2019	(138,471)	388,769	81,603,664	(81,353,366)
2020	(22,241,415)	168,343	65,593,315	(87,666,387)
2021	(45,574,729)	49,170	48,943,739	(94,469,298)
2022	(69,343,218)	7,662	32,464,560	(101,800,116)
2023	(90,496,004)	- 0 -	19,203,801	(109,699,805)
2024	(108,594,438)	- 0 -	9,618,072	(118,212,510)
2025	(123,696,492)	- 0 -	3,689,308	(127,385,801)
2026	(136,355,319)	- 0 -	915,620	(137,270,939)
2027	(147,869,559)	- 0 -	53,604	(147,923,164)
2028	(159,402,001)	- 0 -	- 0 -	(159,402,001)

VII. EFFECT OF FUTURE CONTRACT SALES

We have considered the effect of future contract sales on the existing Fund deficit. Our analysis assumes that contract sales resume for the 2008/09 enrollment period with contract payments beginning in February 2009. We examined three different levels of contract sales: 1,000 contracts each year; 2,000 contracts each year and 3,000 contracts each year. For each of these sales levels, we examined three different premium surcharge levels – 5.0%, 7.5% and 10.0%.

For each of these 9 scenarios, we projected future contract prices for each future projected enrollment period. We projected financial results for each future enrollment period according to the projected number of contracts and the amount of premium surcharge.

The number of future consecutive enrollment periods required to generate sufficient surplus to cure the existing deficit is shown in the table below.

Enrollment Periods Required to Cure Deficit			
Contracts Sold	5% Premium	7.5% Premium	10% Premium
1,000	20 ⁺ ³	14	12
2,000	10	8	6
3,000	7	5	5

³ 1,000 contracts sold with a 5% premium do not generate sufficient margins to cure the deficit until after all current contracts have expired or matured.

VIII. SENSITIVITY TESTING

We believe that when there is a significant amount of uncertainty about conditions prevailing in the future it is important to test for adequacy under other possible assumptions.

We investigated the effect of variances in both university inflation and investment yield assumptions from those anticipated by the adequacy test assumptions. For these projections, we assumed no future contributions. These scenarios are described below. These scenarios are based on level adjustments to the baseline adequacy assumptions discussed earlier in this report.

- 1) Tuition inflation lower than adequacy test assumptions by 0.25% every year.
- 2) Tuition inflation higher than adequacy test assumptions by 0.25% every year.
- 3) Investment yields higher than adequacy test assumptions by 0.25% every year.
- 4) Investment yields lower than adequacy test assumptions by 0.25% every year.
- 5) Tuition inflation higher and investment yields lower than adequacy test assumptions by 0.25% every year.

The deficit for each of these scenarios is shown below.

Sensitivity Testing Results		
<u>Scenario</u>	<u>Deficit</u>	<u>Change From Reported</u>
1	(\$33,262,570)	\$2,492,869
2	(\$38,300,966)	(\$2,545,527)
3	(\$33,222,121)	\$2,533,318
4	(\$38,353,321)	(\$2,597,882)
5	(\$40,956,729)	(\$5,201,290)

IX. MONTE CARLO ANALYSIS

We have updated the model used for Monte Carlo projections. In the last two years, we used a model in which equity returns were realized as a spread against risk-free rates. This year, we have changed our equity return model to a regime-switching model. We believe that this will provide for a better model of returns and inflation than the previous model.

For domestic equities, our regime-switching models retain a connection to the risk-free return through a regression parameter applicable to both regimes. In addition, our regime-switching model has a probability of switching regimes that is conditional on the current regime. This differs from the regime-switching models discussed in the financial literature, which have regime-switching probabilities which are unconditioned.

As in the prior model, parameters are determined through Bayesian techniques.

Risk-Free Return Model

We modeled risk-free returns according to a lognormal distribution. Technically, we modeled the natural logarithm of the risk-free returns as a normal distribution. Modeling the natural logarithm as a normal distribution is exactly equivalent to modeling the underlying value as a lognormal distribution.

Our model for the change in the natural log of the risk-free returns is:

$$Y_t = \text{Normal}(\mu_t, \sigma_t)$$

Where:

Y_t is the natural logarithm of the risk-free return for year t

$\mu_t = -3.3 + .8434 (Y_{t-1} + .03538)$ for the high-volatility regime

$\mu_t = -5.711 + .8434 (Y_{t-1} + .03538)$ for the low-volatility regime

$\sigma_t = .3093$ for the high-volatility regime

$\sigma_t = .2833$ for the low-volatility regime

$p_1 = .0304$ This is the probability of moving from the high-volatility regime to the low-volatility regime

$p_2 = .6461$ This is the probability of moving from the low-volatility regime to the high-volatility regime

Large-Cap Equity Returns

The return model for large-cap equities is a regime-switching model with a regression term based on the change in the risk-free returns.

$$Z_t = \text{Normal}(\mu_t, \sigma_t)$$

Where:

Z_t is the return for year t

$\mu_t = .07874 - .2.482 (Y_t - Y_{t-1})$ for the high-volatility regime.

$\mu_t = .12707 - .2.482 (Y_t - Y_{t-1})$ for the low-volatility regime.

Y_t & Y_{t-1} are the risk free returns for the current and prior years respectively.

$\sigma_t = .2147$ for the high-volatility regime

$\sigma_t = .176$ for the low-volatility regime

$p_1 = .7168$ This is the probability of moving from the high-volatility regime to the low-volatility regime

$p_2 = .0967$ This is the probability of moving from the low-volatility regime to the high-volatility regime

Small-Cap Equity Returns

The return model for small-cap equities is a regime-switching model with a regression term based on the change in the risk-free returns and an autoregressive term.

$$X_t = \text{Normal}(\mu_t, \sigma_t)$$

Where:

X_t is the return for year t

$\mu_t = .1834 - .3.655 (Y_t - Y_{t-1}) + .04948 (X_{t-1} - .162353)$ for the high-volatility regime.

$\mu_t = .18416 - 3.655 (Y_t - Y_{t-1}) + .04948 (X_{t-1} - .162353)$ for the low-volatility regime.

Y_t & Y_{t-1} are the risk free returns for the current and prior years respectively.

$\sigma_t = .2329$ for the high-volatility regime

$\sigma_t = .1889$ for the low-volatility regime

$p_1 = .3836$ This is the probability of moving from the high-volatility regime to the low-volatility regime

$p_2 = .3512$ This is the probability of moving from the low-volatility regime to the high-volatility regime

International Equity Returns

The return model for international equities is similar to the large-cap equity model except that the regression term is based on large-cap returns rather than risk-free returns.

$$W_t = \text{Normal}(\mu_t, \sigma_t)$$

Where:

W_t is the return for year t
 $\mu_t = .08677 + .5752 * Z_t$ for the high-volatility regime.
 $\mu_t = .05855 + .5752 * Z_t$ for the low-volatility regime.
 Z_t is the large cap return for the current.
 $\sigma_t = .221$ for the high-volatility regime
 $\sigma_t = .3166$ for the low-volatility regime
 $p_1 = .5987$ This is the probability of moving from the high-volatility regime to the low-volatility regime
 $p_2 = .1866$ This is the probability of moving from the low-volatility regime to the high-volatility regime

Fixed Income Spreads

Our model for fixed income returns is a regime-switching spread against risk-free returns.

$$V_t = \text{Normal}(\mu_t, \sigma_t)$$

Where:

V_t is the spread for year t
 $\mu_t = .01998$ for the high-volatility regime.
 $\mu_t = .013057$ for the low-volatility regime.
 $\sigma_t = .09965$ for the high-volatility regime
 $\sigma_t = .0576$ for the low-volatility regime
 $p_1 = .8273$ This is the probability of moving from the high-volatility regime to the low-volatility regime
 $p_2 = .0319$ This is the probability of moving from the low-volatility regime to the high-volatility regime

Tuition Inflation

We modeled WAT tuition inflation as regime-switching Beta distributions.

$$U_t = \text{Beta}(\alpha_t, \beta_t)$$

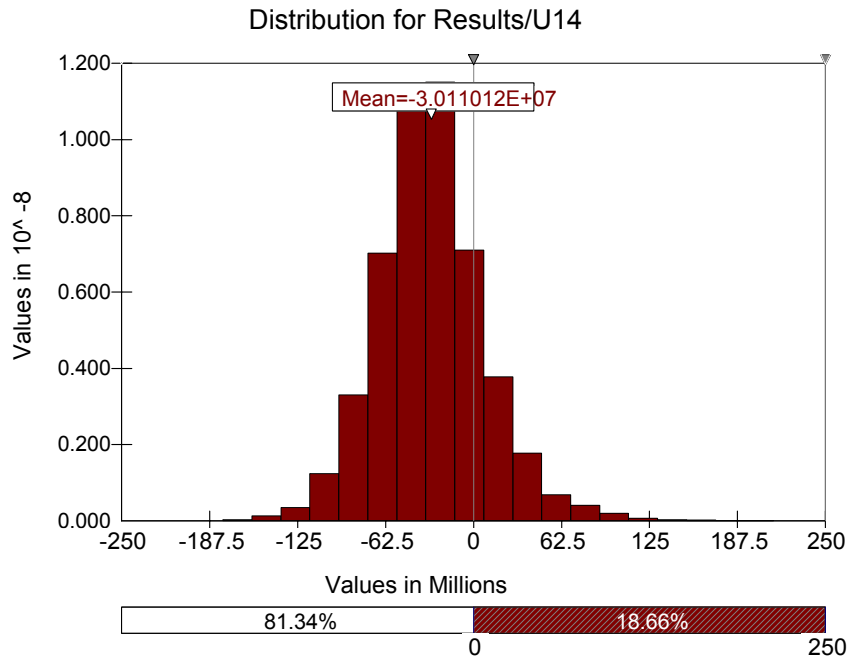

Where:

U_t is the inflation for year t
 $\alpha_t = 0.7685$ for the low-volatility regime.
 $\beta_t = 44.87$ for the low-volatility regime.
 $\alpha_t = 10.5215$ for the high-volatility regime.
 $\beta_t = 89.97$ for the high-volatility regime
 $p_1 = .5619$ This is the probability of moving from the low-volatility regime to the high-volatility regime
 $p_2 = .1905$ This is the probability of moving from the high-volatility regime to the low-volatility regime

low-volatility regime

As in prior years, we ran 10,000 scenarios with varying tuition inflation and investment returns. The results are summarized in the table below and in the chart immediately following.

Proportion with positive Actuarial Reserve	18.7%
25% of results are better than:	(\$8,488,171)
50% of results are better than:	(\$31,755,602)
75% of results are better than:	(\$54,451,576)
Largest Actuarial Reserve	\$233,842,304
Smallest Actuarial Reserve	(\$219,325,408)
Mean Actuarial Reserve	(\$30,110,119)

The most important measures from the table immediately above are the Proportion with positive Actuarial Reserve and the 50% Results. The Proportion with positive Actuarial Reserve probability of 18.7% indicates that there is not quite a 1/5 likelihood that the Program will have a surplus.

The 50% Results measure is a “best-estimate” measure of results. If our assumptions are neither conservative (that is they understate results) nor aggressive (that is they overstate results) then the 50% Results measure should be close to our projected result of (\$35,755,439). The table above indicates that our assumptions are slightly conservative.

The Smallest Actuarial Reserve indicates what happens if economic events continue adversely for the lifetime of the current contracts -high tuition increases, coupled with negative returns in the equity market until the end of the projection horizon. On the other hand, the Largest Actuarial Reserve indicates what happens if economic conditions are favorable for the remaining lifetime of the current contracts.

X. CHANGES IN ACTUARIAL ASSUMPTIONS

We made three changes to the assumptions used in projecting the actuarial deficit. These assumptions changes are, in aggregate, conservative – that is, they cause the deficit to be larger than it would have been without these changes. These changes are discussed below.

Changes in Expenses

We updated the assumption for aggregate expenses to reflect the current budget of the program as shown below. We also updated investment expenses to reflect the revised contract with the investment manager.

Current Assumption	Prior Assumption
Aggregate Expenses	
\$547,528	\$540,620
Investment Expenses	
20 basis points	35 basis points

Change in Tuition Inflation

We revised the tuition inflation assumptions to better reflect our long-term view of what tuition increases will be.

Current Assumption	Prior Assumption
10.0% for 2009/10	8.5% for 2009/10
8.5% for 2010/11	7.0% thereafter
7.0% thereafter	

Dollar Effect of Change in Assumptions

If assumptions had been the same as last year, the Program's deficit would have been:

(\$31,981,542)

These two changes increased the deficit by \$3,773,897. The effect of the inflation assumption change by itself was to increase the deficit by \$4,806,704.

XI. EXPECTED USE OF FUNDS

The Fund, which is comprised of contributions, fees, all interest and earnings, and any other money appropriated or made available to KAPT, is expected to pay benefits and expenses in the following proportions:

- Tuition payments - 96.4%
- Expenses - 1.8%
- Payments of refunds to contract owners - 1.8%

These results are shown graphically below.
